

Mercuri Olive Cleaning Systems:

Sorter machine: MINI IMPERATRICE

General Characteristics

The “MINI IMPERATRICE AUTOPULENTE” sorter, our machine with smaller capacity and smaller dimensions, was designed for cleaning olives with an iron or stainless steel structure, equipped with a blower and a 2-pass rotating drum which does not produce noises during use.

Designed down to the smallest detail in order to satisfy our customers, thanks to our experience in the oil sector, to remove foreign bodies with their leaves, leaving the olives ready for the washing phase.

Design features

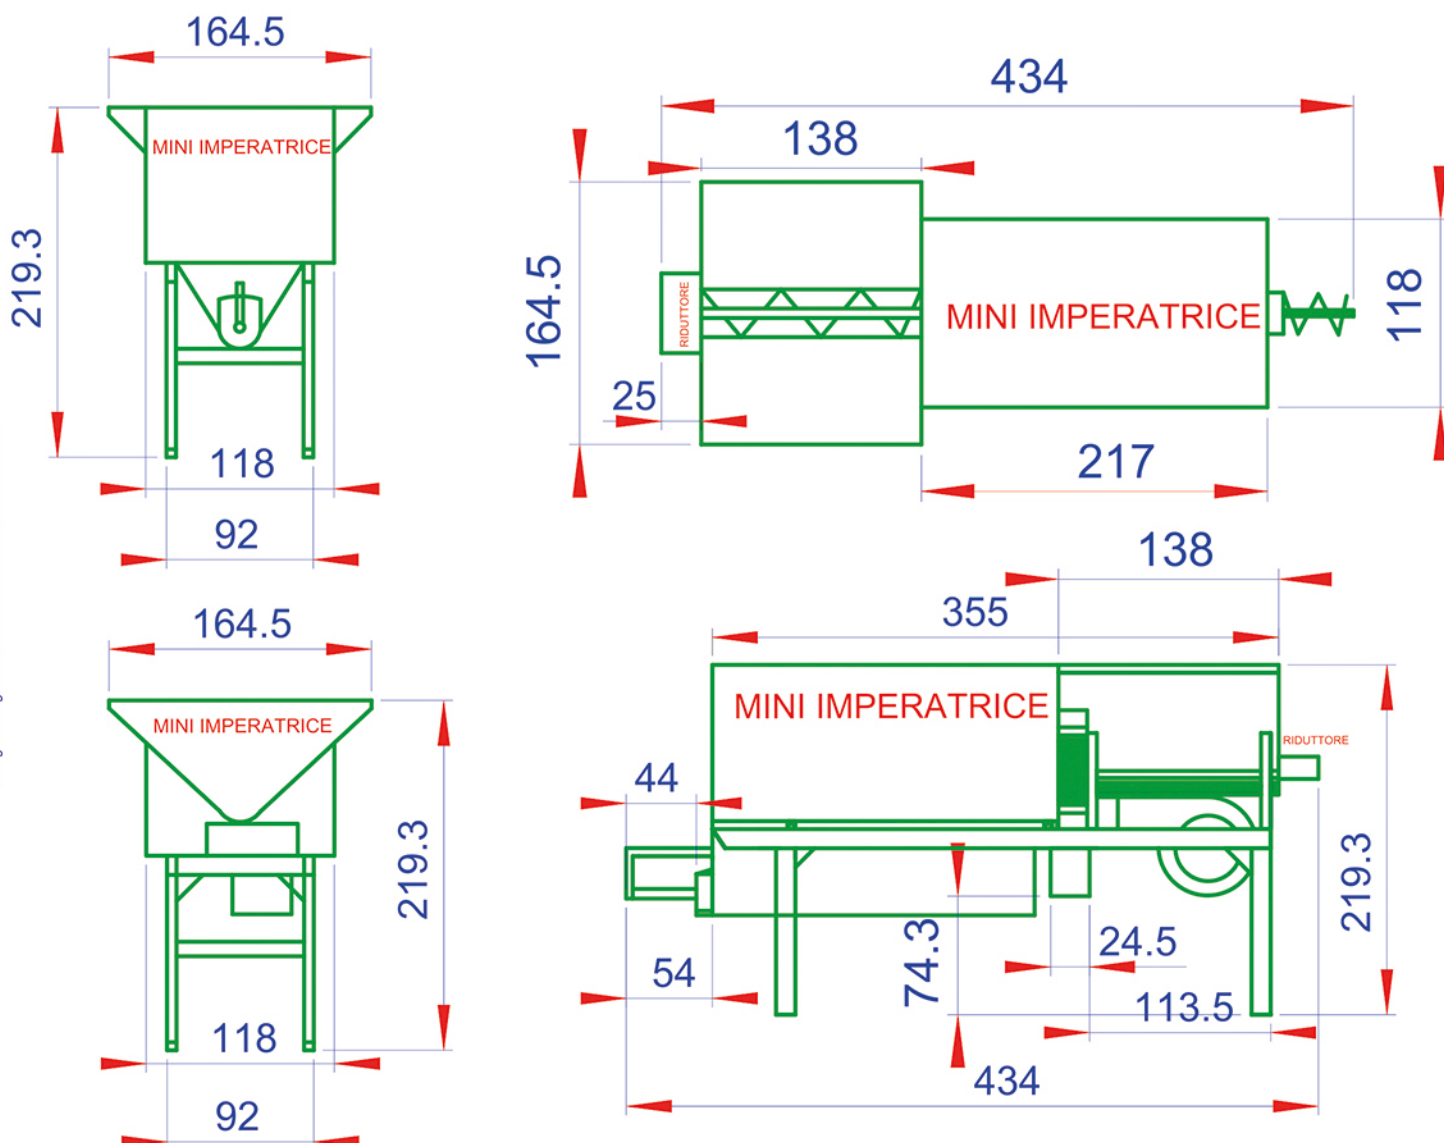

A machine with a simple design. Designed for maximum strength, reliability and ease of maintenance. The “MINI IMPERATRICE AUTOPULENTE” carries out its work silently and with low energy consumption.

PRINCIPLE OF OPERATION

The olives introduced into the loading hopper are immediately transported with a variable feeding screw which pushes them into the first drum with the aim of removing the larger branches and stones, giving rise to the first cleaning phase.

The second phase corresponds to the second drum positioned outside where the blower with a very powerful flow of air it pushes the leaves and small branches outside of it, while the soil, thanks to the rotation of the drum, falls downwards into the auger for discharging foreign bodies.

During the second phase, a spiral positioned inside the external drum pushes the olives towards the blower and then makes them fall into a channel which transports them outside the machine, leaving them clean and ready for the crusher.

Electric Motor: 380 V - 3 hp - Motor Feeder: 1 hp - Exhaust Engine: 1 hp - Output per Hour: 40 q
